ABSTRACT

AI A user transmits a display request to designate contents of a Web page from a receiving terminal. A server has a Web page generation processing section that selects a display control program and data necessary for the operation of the display control program from a storage section of the server. The server adds the display control program and the data necessary for operating the display control program to a standard format Web page that is prepared in advance to generate a new Web page. The new Web page is then transmitted to the receiving terminal through a network. The invention thereby minimizes data that must be provided to the user's receiving terminal and allows for the convenient provision to the receiving terminal of the most current available data. The invention may reside in a Web-based system for providing cost quotations for configurable products desired by the user.
